---

Abstract: Structural planning and design is an art and science of designing with economy and elegance, serviceable and durable structure. . The main objective of the project is to compare the design and analysis of the building along span lengths 3m and 4.5m.This project is to understand the structural behavior of various components in the multi-storied building. The frame analysis is done for the design of columns and beams according to the building by laws and design as per IS 456-2000 code. Design ,analysis and estimation of multi-storied building has been taken up for (G+3) Building of an area 463.25m^2 located behind the Ramesh hospital. Dead loads and live loads are considered according to the code IS 456-2000, footings are designed based on safe bearing capacity of soil. The design of slab is done by using the end conditions like adjacent edges discontinuous, one long edge discontinuous and one short edge discontinuous. We have used Staadd.pro software tool to design structural elements like design of beams and columns.

Key Words: IS:456-2000, Frame analysis, STAAD Pro Software

1. INTRODUCTION: The main aim of structural engineer is to design the structures for safe technology in the computing field. The structural engineer can dare to tackle much more large and complex structure subjected to various type of loading conditions. The loads acting on the structure are considered as static, but with the exception of the self weight (dead load) no structure load is static one. Now a day's large number of application software's are available in the civil engineering field all these software's are developed as the basis of advance. Finite element analysis which include the effect of dynamic load such as wind effect, earth quake effect etc. In this project work, an attempt has been made to study the efficiency of certain civil engineering application software's. For these purpose an on-going project has been selected.

2. STATEMENT OF THE PROJECT:

Utility of the building	: commercial
No of stories	: G+3
No of staircase	: 1
Type of construction	: R.C.C frame structure
Types of walls	: Brick wall
Ground floor height	: 3m
Floor to floor height	: 3m
Walls (externals)	: 250mm thick brick masonry
Walls internal	: 250mm thick brick masonry

MATERIALS:

Concrete grade:	M30
All steel grades:	HYSD bars of Fe415 grade

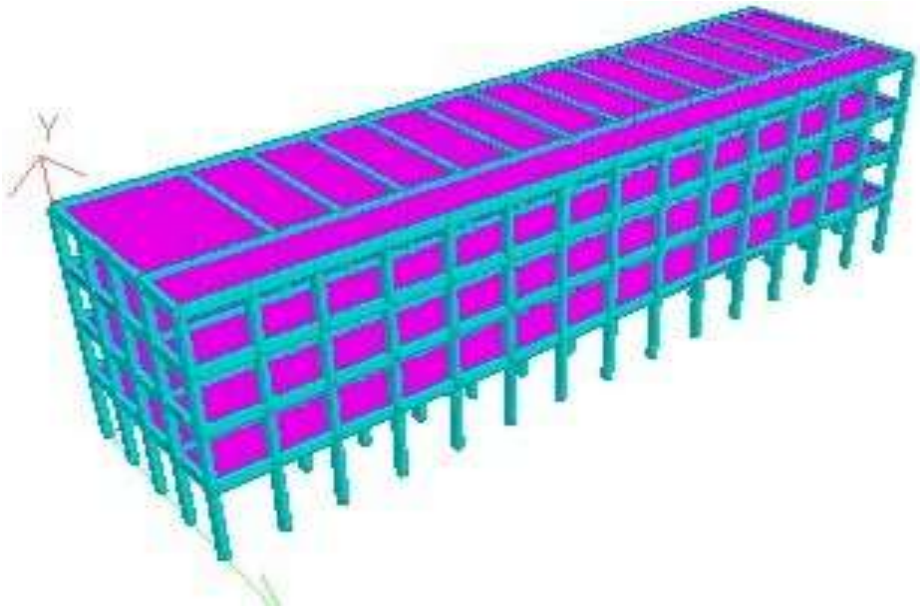

Fig1: Geometric design For 3 m building

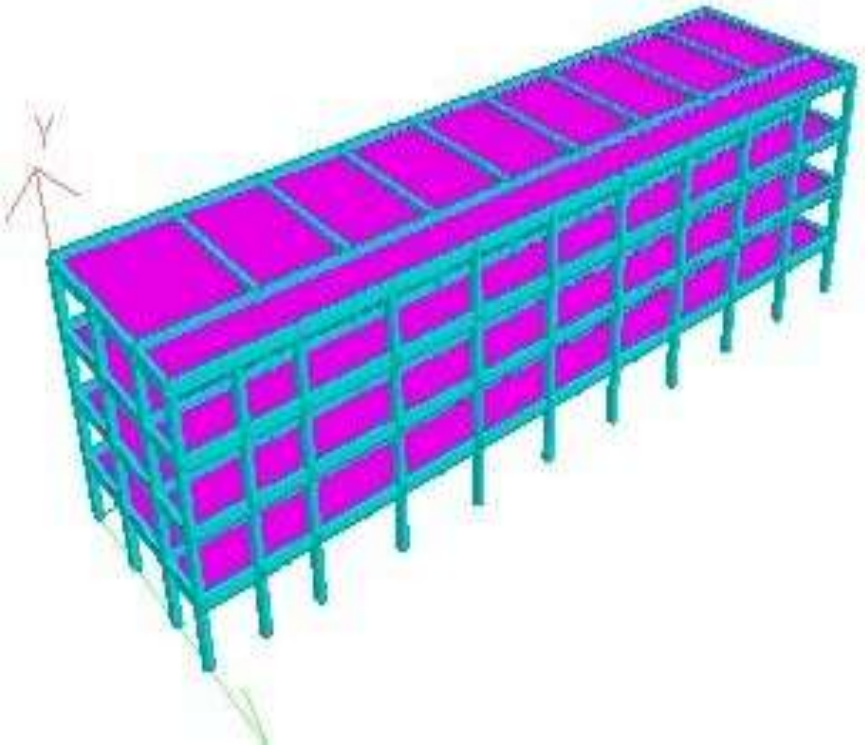

Fig 2: Geometric design For 4.5 m building

3. PLAN: Our building plan consists of G+5 floors of all are commercial. It is having an area of 463.25sq.m. Now we are showing the figures of floor plan, centre-line diagram, beam layout, column layout.

11. CONCLUSION: In this study, it is observed the volume of concrete in 3m span & 4.5m span as follows.

SLABS: For 3m frames spacing slab is designed as one way continuous slab.
For 4.5m frame spacing the slab is designed as two way continuous slab.

CONCRETE: Total volume of concrete for 3m frame spacing 229.4m^3
Total volume of concrete for 4.5m frame spacing 181.7m^3

STEEL: Total weight of steel for 3m frame spacing 171875N
Total weight of steel for 4.5m frame spacing 136235N
From the above results the volume of concrete used is less when compared to 3m spacing. It is more economical when compared with the usage of steel.
from above results and comparison so one can adopt 4.5m frame spacing.
